- MongoDB
- SASS

Soft Skills

- Communication
- Adaptability
- Problem-solving
- Time-Management
- Teamwork

Front End Developer

Mihailescu Fanush Gabriel

Hello, my name is Fanush and I am a front-end developer. I've been learning the ways of web development for about a year, and I absolutely love it! I like coming up with creative solutions to problems, and I always enjoy working on projects that are visually appealing that have innovative interactions for users. I'm looking to hone my skills even more so I can find a position as a front-end developer in the near future. In the meantime, I'm working on developing my portfolio. Some of my work can be seen here on my Github profile.

Work experience

Front-End Developer at Frontend Mentor **Freelance**

May 2022 - up until now | Bucharest

- Frontend Mentor provides designs so that you can practice your front-end skills using a real-life workflow. The challenges include designs (both mobile and desktop), assets, and a style guide to get you started.
- Worked on different projects that allowed me to learn a lot about different topics such as form validation, DOM Manipulation, creating visually appealing designs, making API calls, switching off your entire workflow and trying different frameworks for styling such as Sass instead of plain CSS, React instead of vanilla Javascript.
- I also enjoyed challenging myself to do these projects in a fixed amount of time.
- Got comfortable with versioning systems such as Git

Administrator Settlement & Billing **DKV Euroservice**

April 2021 - Until May 2022 | Bucharest

- Administrative activities related to monitoring and error handling of electronic transactions.
- Verification and processing of incoming supplier invoices including the pursuance of divergences in the cost of sales checking procedure (WEDP)
- Identification, analysis, and communication on billing problems with internal teams and DKV suppliers

Sales & Customer Service Support **Royal Canin**

July 2019 - July 2020 | Bucharest

- Ensure the development of customers and sales in the dedicated area by selling proactively through phone
- Resolved promotional allowance, rebate, and pricing discrepancies by researching promotion details and regular and special prices; forwarding resolution to managers
- Follow up clients' database (working on Set2Sell)
- Invoices corrections – queries from customers

Projects

1. [Portfolio website](#)

It was challenging to come up with a simple yet appealing design but I believe I made a good choice and I am proud of the way it looks and behaves. I got to learn a lot about animations centering elements using different layout systems such as CSS Grid and Flexbox combined to provide a solid and responsive structure.

Technologies used: **HTML, CSS, SASS, Javascript**

2. [CodeLearn App](#)

This is still a work in progress but it's an amazing project that I work on. Shortly described, it's a website where you can solve different algorithmic problems. This idea came to me when I was also solving these problems.

The final goal is that the user will be able to create an account, receive an activation link then login and start solving different problems. There is also an admin part of the page which is currently displayed where the admin can add, remove, edit and delete problems at will. It was done with the CRUD methodology in mind. So far the login, register and forgot password pages are working, the home page with the exercise is available for testing, you can do whatever an admin can do.

Technologies used: **HTML, CSS, SASS, Javascript, NodeJS, MongoDB, ExpressJS**

3. [Quiz App](#)

This is a lovely quizz app created with ReactJs as part of my interest in learning how react works and how to create components, send props, manage state and use different hooks. It is a very exciting project created from scratch and I learned a lot doing it.

Technologies used: **HTML, Module CSS, ReactJS, Javascript**

4. [Frontend Mentor](#)

This is an incredible website and it has been a huge part of my development so far as I got to learn everything from the easiest things such as displaying text on a website to more complicated topics such as using BEM to manage your CSS and HTML naming to make it easier to understand, SEO to make your website more visible and overall best practices when it comes to everything Web Development.

Another reason why this platform is so good is because you get to do projects without thinking about design necessarily and you also have a big and active community full of professionals willing to help you develop your skills.

Technologies used: **HTML, Module CSS, ReactJS, Javascript, Figma, SASS, Github**

Education

Liceul Teoretic "George Calinescu"

Matematica-Informatica

October 2012 - June 2016 | Bucharest
